

City of Alpena

News Release of March 1, 2024

UPDATED

State of Michigan Lead and Copper Rule

In accordance with the State of Michigan Lead and Copper Rule, the City of Alpena will continue to conduct a mandated Distribution System Materials Inventory for all residential water services within the City of Alpena. The purpose of this is to identify homes with water connection lines that are either made of lead or contain lead. This inventory must be completed by January 1, 2025.

To adequately inventory the existing water services, a City representative will need to access residences and water meters within the homes. Any residences where the water supply is determined to be lead or lead-containing will be notified in writing after the survey is completed.

Beginning Monday, March 4, the representatives for the City will begin their survey in the area between Fletcher Street and Commerce Drive, Ford Avenue and Woodward Avenue. Additionally, residences along Long Rapids Road and in Island View and Gilchrist subdivisions.

This survey is the first step of several required by the Lead and Copper Rule. After completion of the survey, the City will also perform other verification investigations within the system. Ultimately, any residence found with lead or lead-containing materials will need to be replaced, however, this work will be done spanning several years concluding in 2040. The State of Michigan requires that all service lines requiring replacement under this program are completed at the expense of the water supply (City).
